

Press Release

Overclean Ltd

For immediate release – from 13th April 2021

Overclean first to gain SVQ Units in Ventilation Hygiene Cleaning

Working throughout the recent COVID 19 pandemic Overclean Ltd have managed to continue to strive to raise the bar in training standard for ventilation cleaning. A group of Overclean's technicians completed their NOS training and were awarded the SVQ Units on 11th April 2021. Overclean once again, are first to mark an achievement in this sector.

In keeping with the company's commitment to continuous improvements, of our practises and procedures, our ventilation technicians have recently attended an upskilling and assessment programme, which has resulted in them being awarded several National Occupational Standards within the Ventilation Sector, including the BSEBSE 01 (Health & Safety), SUMMES25 (Inspect and Test Systems) and the BSEHV11, the National Occupational Standards for Cleaning Industrial and Commercial Ventilation Systems.

We would like to take this opportunity to express our thanks to Paddeco Ltd for their support and guidance in attaining these National Occupational Standards.

This will help demonstrate, to our existing and future clients, that our technicians, having been assessed and audited, are working to the highest levels of competence and compliance, and Overclean are fully committed to improving every facet of our business.

Ben Ledger, Sales Director for Overclean Ltd, says "We are immensely proud to have completed the first phase of our training programme to SVQ level. This is the first time in our industry we have an independent third-party assessment centre delivering an accredited training programme. This gives our clients peace of mind in their selection of a company who has competent trained staff and cleaning to a set high standard. The competency of our teams shows our commitment to the government's "Building a Safer Future Charter "by investing in training and continuing professional development. Again, improving skills will support our commitment to improving indoor air quality in buildings."

Inspection, cleaning, and maintenance of ductwork has become an important part of building facility requirements to meet the growing need for better indoor air quality and building energy efficiencies.

Insurance companies are aware of the essential requirement to undertake cleaning ventilation systems to prevent the build-up of grease and dust in ducts to prevent fires.

Along with the regulatory law EC852, HSE requirements, CDM regulations and BS standards, all building owners should be aware of their responsibility to the occupants of the building and ensure that regular inspection, cleaning, and maintenance of ductwork is carried out by a competent accredited company.

Overclean's achievement endorses the company ethos in training and delivering a high-quality standard of cleaning and customer satisfaction.
